## AIR TRONIC – *protective mask testing kit*

Differential pressure tester for medical & respiratory mask testing

Mesdan's AIR TRONIC is one of the most popular **Air Permeability tester** on the market. Following the COVID-19 crisis and market demand for medical face mask testing, Mesdan developed a "**Medical mask testing kit**" according to **EN 14683:2019 (Annex C)** and **ASTM F2100:2019 (point 9.2)**, for what refers to the **differential pressure** only, measuring the pressure difference above and below the specimen, used mainly for surgical masks.

With the new Kit both fabric and ready-made mask can be tested, the Kit could be either integrated into a new AIR TRONIC or installed onto an existing AIR TRONIC.

Two different models of AIR TRONIC are available: a small bench top and a movable stand-alone unit, with internal silent motor (the PLUS version). Additional unique feature available for AIR TRONIC is the assessment software for the measuring of the "average fabric pore size".
